Too Soon to Think About The Next Recession?

One short week after witnessing a return of interest rate volatility, it disappeared again this week. Mortgage rates saw **some** small-scale ups and downs, but generally held very close to last Friday's levels. All this despite the presence of important economic data and a policy announcement from the Fed.

Investors are **wrestling with bigger decisions** about where the economy goes from here. This might seem a bit silly considering economic data has been stable and strong for so long, but financial markets are always doing their best to price-in the future.

When the tax bill was just coming to fruition in early 2018, the future seemed much clearer. Treasury yields would still have to rise because they hadn't yet priced-in the excess government debt supply associated with the tax bill (more supply = higher rates).

On the other side of the market, equities traders were **just beginning** to price-in the tax bill's anticipated effect on corporate earnings. And of course, the Fed would have to hike rates a bit more quickly if the tax bill ended up having a stimulative effect.

As of mid-February, markets were telling us this "pricing-in" process was potentially winding down. Bonds had reached a bit of a plateau and were **finally** moving sideways. Stocks had recovered from the early February flash crash and began to consolidate without making new highs. We even saw a plateau in the markets that bet on the Fed's rate hike pace.

Then the **trade war headlines** began to circulate. This was to be the theme that would underpin a growing level of indecision in the marketplace. It was the manifestation of the question: have investors priced-in enough of the future's positive economic potential?

While it **may** well be **far** too early for the debate, the question of the timing of the next recession (or simply the next economic deceleration) is already being asked. One of the most common arguments in favor of asking the question is the falling (or flattening) "yield curve"--the spread between 2yr and 10yr Treasury yields.

Although many pundits and even several Fed members have opined that **history will not repeat itself** in the same way this time around, in the past, an

National Average Mortgage Rates

inverted yield curve (2yr > 10yr) has preceded 3 out of the last 3 recessions.

Economy vs Yield Curve

As you might guess, a recession has negative implications for stocks, but it typically coincides with lower interest rates. The timing **isn't coincidental**. Stocks have been consolidating in an ever-narrower range. This means they **MUST** break out soon.

US Housing Market Weekly

Bonds are also at a crossroads, having just lived through their **2nd** encounter with the **most important rate ceiling** in more than 10 years. We've already discussed reasons that 3% shouldn't be as firm of a ceiling when comparing the present situation to that seen in 2013/2014, but some investors are still holding out hope. Granted, it **COULD** happen if the bigger picture gets cloudy enough, quickly enough, but the 2 pessimistic scenarios in the following chart of 10yr yields are also on the table.

US 10yr Yield

US Housing Market Weekly

As for nearer-term, smaller scale considerations, the **unsung hero** of the past few weeks (and potentially even the past few months) has been a downturn in European economic data and European bond yields. The German 10yr yield is the representative benchmark rate for Europe, and it's arguably been leading the way for US 10yr yields at times.

This week, a **sharp** drop in European rates helped US rates just as much as the important domestic data that came out on Wednesday (a Treasury auction announcement that allayed concerns about how new bond supply could hit the market, and the Fed's relatively tame policy announcement). Things will get more interesting if German yields manage to break the floor seen in the lower pane of the chart (and interesting in a bad way if they break the highs seen during the last "bounce"):

US vs European Bonds

US vs European Bonds

The modest volatility at the end of the week came courtesy of the **big jobs report**. The job tally missed the mark, but was essentially 'as-expected' after we count last month's revisions. Wage growth slowed, but not in a terrifying way. At first glance, the slightly weaker data was good for bonds, but because last month's data was so rotten, **this month's** only had to come close in order to keep bonds from getting too excited. With that, rates finished out the week roughly unchanged.

In **housing-related news**, Pending Home Sales improved, but by slightly less than forecast. The series continues grinding sideways near its post-crisis plateau--something that's unlikely to change without a big shift in the inventory situation.

Service oriented, responsive, competitive rates and an in depth knowledge of today's mortgage market

After completing my degree in finance at the University of Connecticut, I started in the mortgage business right out of college in 2004. With 15+ years of experience and a primary objective of thoroughly explaining all available loan options to my clients with what is typically the largest investment in their lives, I strive to always make myself available. I constantly educate myself with respect to the mortgage industry and underwriting guidelines for FHA, VA, conventional and jumbo financing. I deliver on the expectations discussed up front and provide the service level my clients deserve from day one. I will remain in touch throughout the process and continue to follow up with you after closing. My goal is to wow you and turn you into clients for life. I want you to be so impressed that throughout and after the process you share my information with your friends, family, neighbors and co-workers who may value from my services.
